# Queering metascience

*So let's build an open and reproducible science as a queer reimagining of science and not a small perturbation of the world that is. Such a system will never be perfect.*

– Dan Simpson [9]

# Preregistration is redundant, at best

The Centre for Open Science defines **preregistration** as specifying the research plan in advance [7].

2019: Preregistration is Hard, and Worthwhile, Nosek *et al.* [6]

2019: Is Preregistration Worthwhile? Szollosi *et al.* [10]

*The diagnosticity of statistical tests depend entirely on how well statistical models map onto underlying theories, and so improving statistical techniques does little improve theories when the mapping is weak [10].*

# Mathematistry

Navarro, a mathematical scientist specialising in psychology, redefines Box's term **mathematistry** [1] to

*‘describe using formal tools to define a statistical problem that differs from the scientific one, solving the re-defined problem, and declaring the scientific concern addressed’ [5].*

We will think of **mathematistry** as the measure of strength of mapping to describe when the mapping is weak [10].

A value judgement is, after all, an order

# Heuristics of mathematistry

# Heuristics of mathematistry

A heuristic can be thought of in terms of a mapping from  $C \times M$  to some space of measuring how well a pairing ‘furthers the process of scientific discovery’ (Devezer *et al.*, 2019) [4].

`fpd` := furthers the process of scientific discovery

# Heuristics of mathematistry

$$h : C \times M \rightarrow \begin{cases} \{0, 1\} & \text{if fpd or not;} \\ [0, 1] & \text{if fpd on a spectrum;} \\ H & \text{if fpd otherwise.} \end{cases}$$

# Heuristics of mathematistry

Let  $C$  denote the set of all possible **scientific claims** for which we might provide evidence of, with a scientific method or procedure.

Let  $M$  denote the set of all possible **scientific methods** that can be used to provide evidence of scientific claims.

The product  $C \times M$  denotes the collection of possible **pairings of claim and methodology**.

# Heuristic of mathematistry

## Definition

A **heuristic  $h$  of mathematistry** measures the efficacy of a pairing  $(c, m)$  of scientific claim  $c \in C$ , and method  $m \in M$  of providing evidence of that claim, measuring how effective method  $m$  is at scientifically informing claim  $c$ .

We denote  $\mathbb{H}$  to be the set of all possible heuristics of mathematistry. For a heuristic  $h$  in  $\mathbb{H}$ , we define the value  $h(c, m)$  as the **measure of mathematistry** of pairing  $(c, m)$  under heuristic  $h$ .

## A value judgement on *good enough* [11] science

For a heuristic  $h$  to be a member of  $\mathbb{H}$ , there must exist a scientific method  $m$ , and two distinct scientific claims we might reasonably pair  $m$  with,  $c_1$  and  $c_2$ , such that

$$h(c_1, m) < h(c_2, m)$$

or, conversely, there must exist distinct methods,  $m_1$  and  $m_2$ , such that, for a claim  $c$ , we have

$$h(c, m_1) < h(c, m_2).$$

# A relational operator of mathematistry

## Definition

Let  $(c_1, m_1) \rightarrow_h (c_2, m_2)$  if and only if  $h(c_1, m_1) \leq h(c_2, m_2)$  under heuristic  $h$  of mathematistry.

# Order

To be considered an order,  $\rightarrow_h$  must satisfy three properties [3].

## Definition

A binary relation  $\leq$  on set  $P$  is an **order** if, for all  $x, y, z \in P$ , we have

- (i)  $x \leq x$ ,
- (ii)  $x \leq y$  and  $y \leq x$  implies  $x = y$ ,
- (iii)  $x \leq y$  and  $y \leq z$  imply  $x \leq z$ .

# Order

- (i) **reflexivity**  $x \leq x$ ,
- (ii) **antisymmetry**  $x \leq y$  and  $y \leq x$  implies  $x = y$ ,
- (iii) **transitivity**  $x \leq y$  and  $y \leq z$  imply  $x \leq z$ .

When a binary relation satisfies (i) reflexivity and (iii) transitivity, but not (ii) antisymmetry, we say it is a **quasi-order**.

# A quasi-order of mathematistry

## Definition

When a binary relation satisfies (i) reflexivity and (iii) transitivity, but not (ii) antisymmetry, we say it is a **quasi-order**.

Let  $\mathcal{X} \subseteq C \times M$  denote the subset  $\mathcal{X}$  of reasonable pairings  $C \times M$  of claims and methods.

## Lemma

*The relation  $\rightarrow_h$  is a quasi-order on  $\mathcal{X}$ .*

# Partitions of mathematistry

Define the equivalence class of mathematistry generated by a reasonable pairing,  $(c, m) \in \mathcal{X}$ ,

$$[[c, m]]_h := \{(x, y) \in \mathcal{X} \mid h(x, y) = h(c, m)\}.$$

We then have reasonable pairings,  $\mathcal{X}$ , partitioned by mathematistry,

$$\mathfrak{X}_h := \mathcal{X} / \rightarrow_h.$$

# The Order of Mathematistry

The relation  $\rightarrow_h$  is a quasi-order on  $\mathcal{X}$ , only satisfying reflexivity and transitivity, but not antisymmetry.

It can be shown that  $\rightarrow_h$  on  $\mathfrak{X}_h$  satisfies reflexivity, antisymmetry, and transitivity.

Theorem

*The relation  $\rightarrow_h$  is an order on  $\mathfrak{X}_h$ .*

Definition

We refer to

$$\langle \mathfrak{X}; \rightarrow \rangle_h := \langle \mathcal{X} / \rightarrow_h; \rightarrow_h \rangle$$

as the **order of mathematistry** under heurisc  $h \in \mathbb{H}$ .
